

Windscreen Scratch repair kit-s130

Contents:

- Polishing powder
- Polishing pad
- Sponge
- Marking pencil
- Empty plastic bag
- Instructions

Instructions

1:Obtain a wide topped container large enough to take the polishing pad (a clean plastic margarine tub will do).

2:Put approx one egg cup of the powder into the container and add three egg cups of water, mixing thoroughly. Place the polishing pad in the mixture leave for five minutes.

3:Clean the area to be repaired to remove all traces of dirt.

4:Using the marking pencil, mark the position of the scratch on the opposite side of the glass (this will act as a guide when polishing).

5:Fix the pad in the chuck of an electric drill, maximum speed 1500 rpm.

6:Start the drill and apply the face of the rotating pad to the scratch, moving the pad with a rocking motion along the length of the scratch.

NOTE: DO NOT KEEP THE PAD IN CONTACT WITH THE GLASS FOR MORE THAN 20 SECONDS AT A TIME OR TOO MUCH HEAT WILL BUILD UP.

7:Keep the polishing pad wetted with the mixture and periodically wipe the area being polished with the wet sponge to see if the scratch is still present

8:When the scratch has been removed, wipe the residue from the glass with the wet sponge. Use a small amount of the mixture on a cloth to remove the pencil mark.

9:Wash the polishing pad in water and store in the plastic bag.
